Dear Mr Roux

After visiting Kamfer Dam as a tourist and bird watcher several times I feel it would be irresponsible to allow this development. I believe that the most appropriate land-use of these properties would be as a conservation buffer zone within a protected area around Kamfers Dam to protect this sensitive natural asset of international importance and high conservation value.

The following issues concern me about the Northgate development

. Kamfers Dam is a proclaimed Natural Heritage Site of high biodiversity and conservation value, and an Important Bird Area of international significance which supports many waterbird species including, at times, ca. 60,000 Lesser Flamingos. Kamfers Dam is now the first breeding site for the globally threatened Lesser Flamingo in South Africa, only the fourth breeding site in Africa and the sixth in the world. The avifauna specialist study for the EIA stated that any impacts on Kamfers Dam would be at a national scale as it is an Important Bird Area and Natural Heritage Site. In addition, the specialist stated that any impacts on the Lesser Flamingo population would be of international significance and even with all mitigating measures in place there will be low impacts and residual impacts at a national and international scale. The Northgate housing development is within the catchment area of Kamfers Dam and would have greater environmental impacts than using a previously disturbed site or another site not linked to a sensitive natural environment

There are other areas that could be used for developing Northgate- to the west or east of Kimberley in areas already zoned for residential enhancement and within the urban edge in the Sol Plaatje Municipality's Spatial Development Framework (SDF) would lead to sustainable environmental development. This would also be in legal compliance with the SDF. The SDF is a legally required document forming the foundation of a municipality's IDP, all planning decisions on development applications must be based on the extent that the application conforms with and gives effect to the SDF. The IDP binds the Municipality in the exercising of its executive authority. In the SDF more

than half of the proposed Northgate area is zoned within the Kamfers Dam Flamingo Conservancy Area and the rest of the area is zoned to support tourism and hospitality for the Kamfers Dam conservancy. The area is not zoned for residential and business development. So why has the municipality disregarded the SDF and approved the rezoning of that area to residential and business for the Northgate development, even before the EIA has been completed? Valid alternative sites were not assessed in the draft EIA even though this was requested by various interested and affected parties.

The EIA indicates that this project would contribute significantly to the much needed sustainable economic and social development in Kimberley. However, it is our opinion that the Northgate development and the development should not be approved for this proposed site, but proceed at an alternative site based on the following facts (1) this proposed development is being applied for in areas not zoned for residential or business but for conservation, tourism and hospitality in the SDF, (2) it has major mitigating measures that will need to be implemented, (3) the necessary costly significant upgrades to the sewage and electricity bulk services that are already over capacity, (4) the biodiversity offset required, and (5) the potential long-term impacts on the Kamfers Dam ecosystem.

Please include this letter in the final EIA report.

Yours sincerely

Jean Stephenson
